

Chapter 8

How to work with data types

Exercises

1. Write a SELECT statement that returns these columns from the Products table:

The list_price column

A column that uses the FORMAT function to return the list_price column with 3 digits to the right of the decimal

~~point~~
A column that uses the CONVERT function to return the list_price column as an integer

A column that uses the CAST function to return the list_price column as an integer

2. Write a SELECT statement that returns these columns from the Products table:

The date_added column

A column that uses the CAST function to return the date_added column with its date only (year, and month)

A column that uses the CAST function to return the date_added column with just the year, month and day

A column that uses the CAST function to return the date_added column with its full time only (hour, and minutes)
